

Hi,

I am a software engineer at an agri-tech startup, Ricult. From the job posting, it seemed like I would be a good match for the position.

For starters, I already have experience in working with teams scattered across the globe in different time zones. Moreover, I have a good amount of experience in working closely with users on an app that has multiple stakeholders. I have worked end to end on features that need to scale to millions of users, and have been responsible for improving developer workflows through developing my teams documentation and testing suites. As for myself, I enjoy working of challenging and difficult problems, so every instance of my work life I am learning something new. Sometimes, I enjoy working on fun things, like I mentioned with developing my teams testing suite, or when I had to dig through an open-sourced marker clustering library developed by Google for a feature I was working on. I find that it's my search for new things to learn that shape my journey as a developer and have been the reason I would consider myself, despite having spent less time professionally as a developer, being in a much stronger position than people in similar roles.

I hope you find that I am a good match for the company, and my previous achievements demonstrate that I would be a strong addition to the team.

Sincerely,

Talha Aamir
